

The Startup Builders:

Ep1: Scaling with Serverless

1st episode of three-part webinar series Bob Gregory, Chief Architect, Cazoo Rob De Feo, Startup Advocate, AWS

Speakers

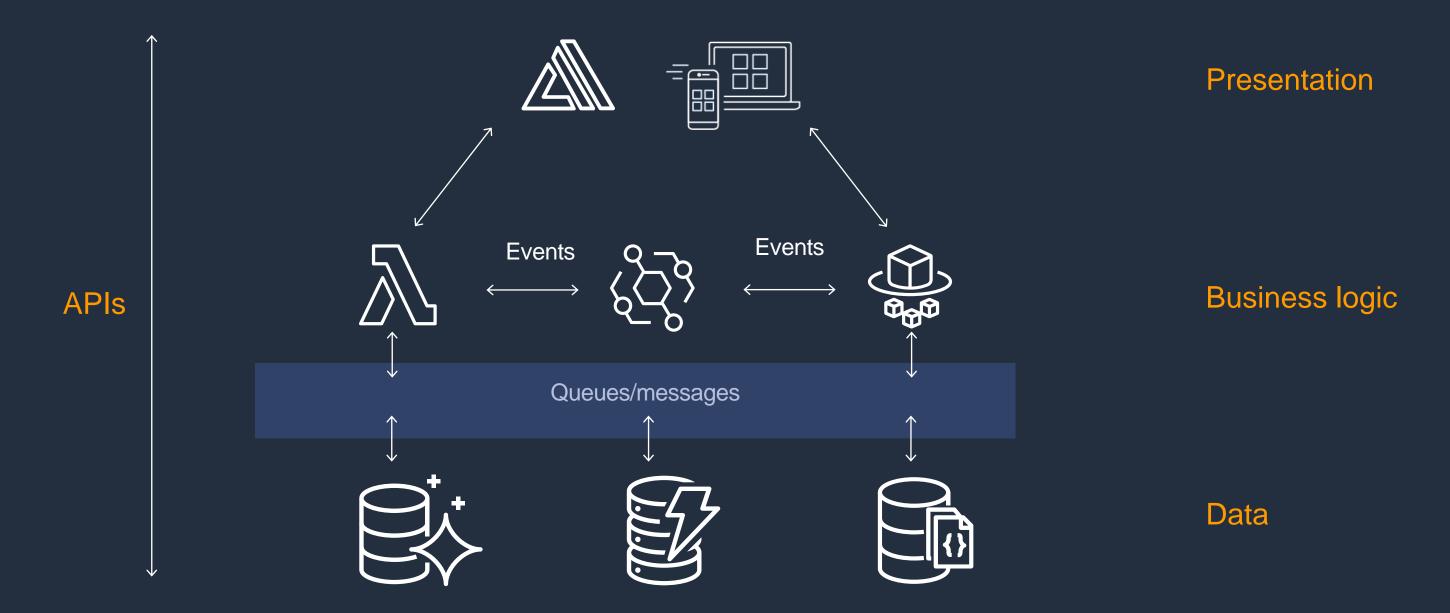

Bob Gregory,
Chief Architect, Cazoo

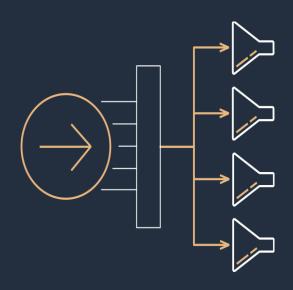

Rob De Feo, Startup Advocate, AWS StartupEngineering.co

A modern three-tier application architecture

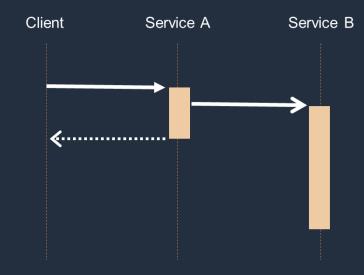

Event-driven architectures drive reliability and scalability

Event Routers

Abstract producers and consumers from each other

Asynchronous Events

Improve responsiveness and reduce dependencies

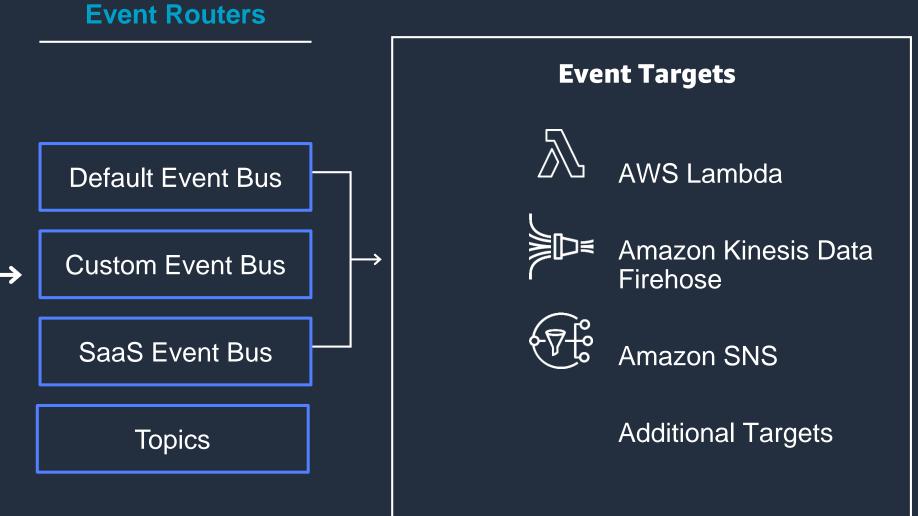

Event Stores

Buffer messages until services are available to process

SaaS Event Sources

AWS operational responsibility models

Hadoop on EC2

Analytics

Hadoop

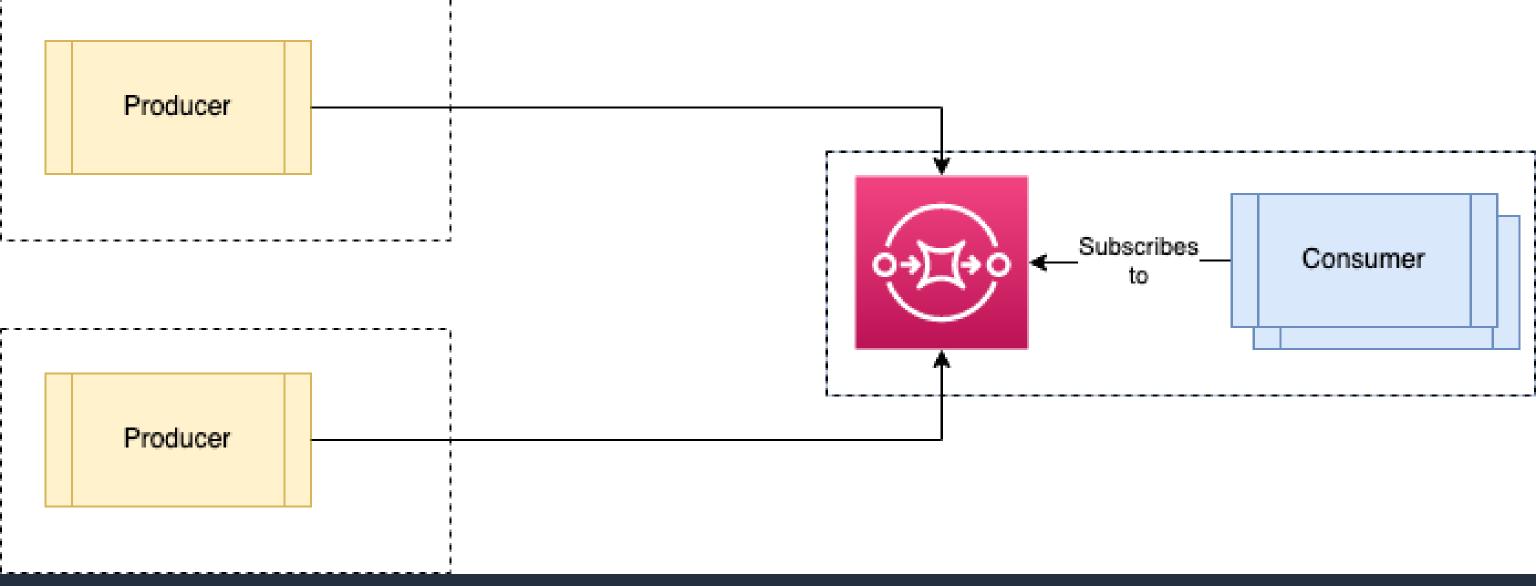

Consumers subscribe to a **TOPIC** owned by the producer. Systems are coupled by message schema and topic arn.

Great for high throughput, low latency systems.

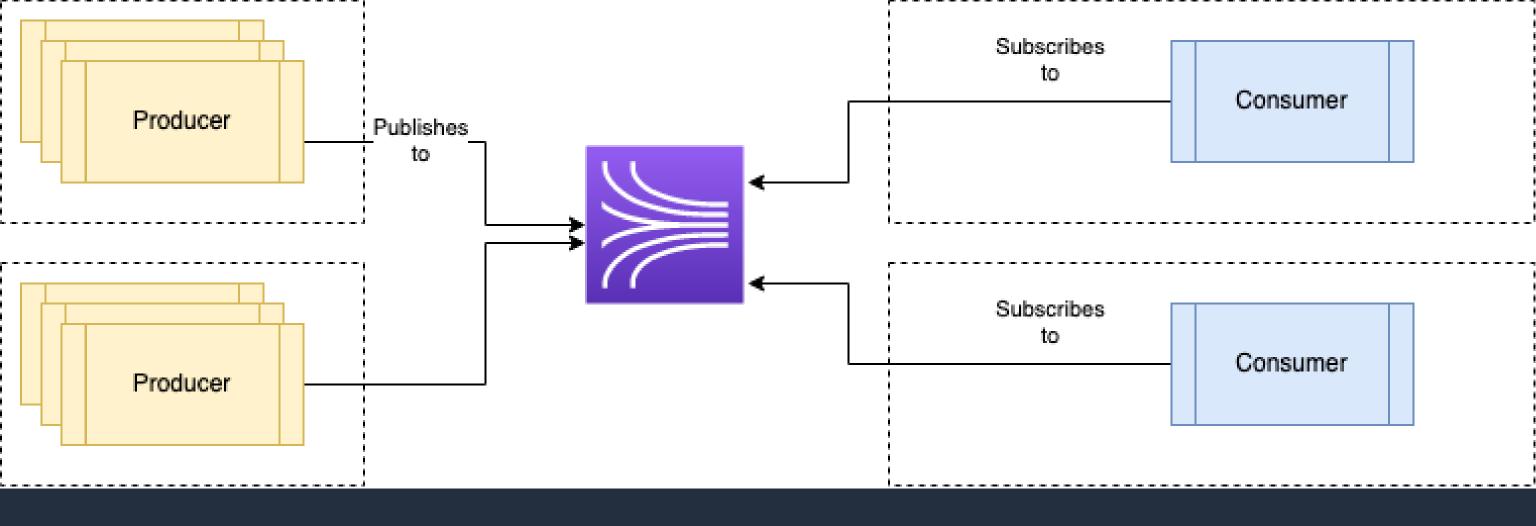

Sucks for refactoring boundaries.

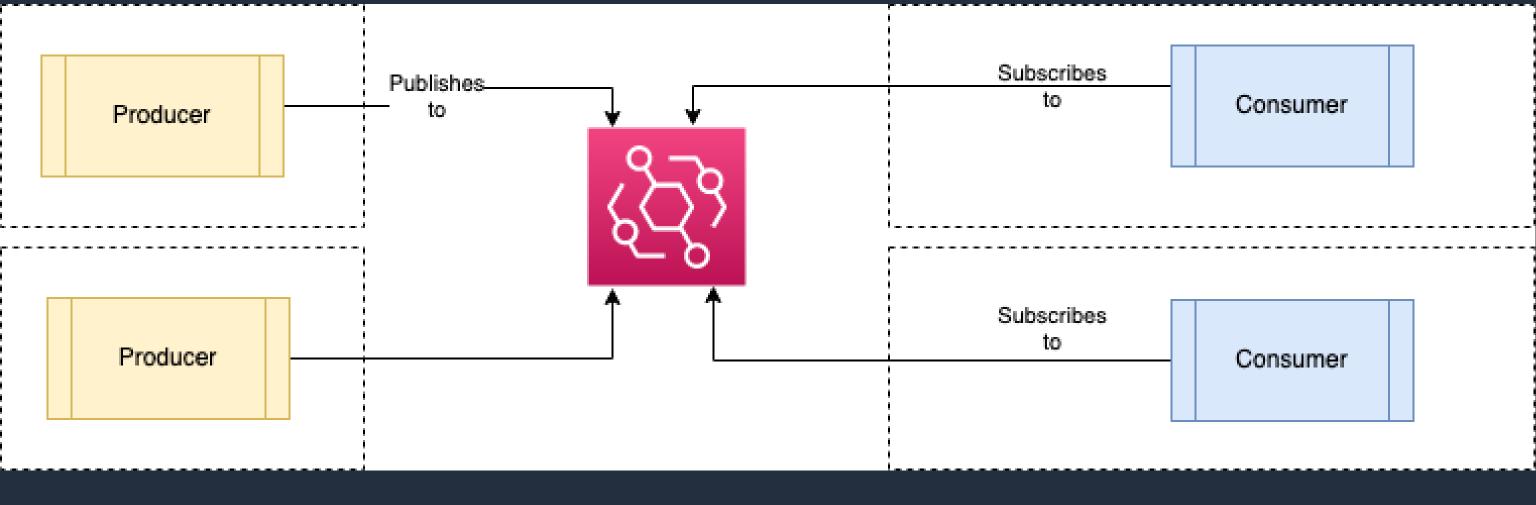

Producers push to a **QUEUE** owned by the consumer. Systems are coupled by message schema and queue arn. Great for parallel processing of work items, message ordering. Sucks for multiple consuming services, refactoring boundaries.

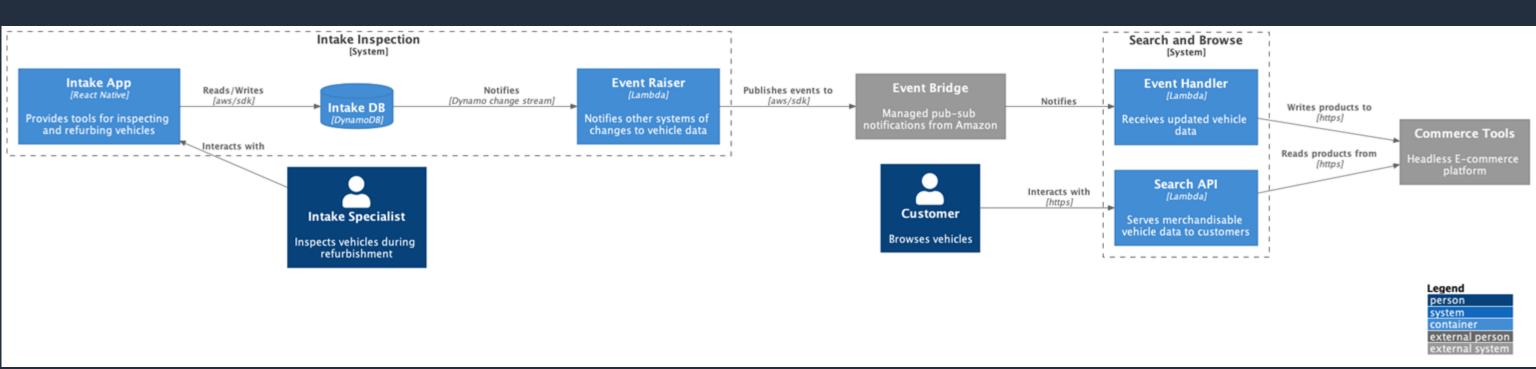

Producers push to a **STREAM** read by consumers. Systems are coupled by message schema and stream arn. Great for huge write throughput., message ordering Sucks for many consumers.

Consumers and Producers share a MESSAGE BROKER
Systems are coupled by message schema.
Great for general purpose messaging.
Sucks for message ordering; high throughput, low latency.

Within a system, use whatever integration pattern is simplest.

Between systems, prefer EventBridge

Thank you

UPCOMING:

2nd episode – <u>Leveraging Containers and Structuring a</u> <u>Microservices Architecture</u>

October 13th

Event Driven Architecture Workshop - https://eventdrivenarchitecturestartup.splashthat.com/
